

## Speed monitor BA 9055, AA 9050 varimeter

0225072

- According to IEC 255, EN 60255, VDE 0435 part 303
- Detection of
  - underspeed
  - overspeed
  - standstill
- Adjustable response value
- BA 9055 with adjustable start-up delay
- AA 9050 with adjustable hysteresis
- Width 45 mm

### Application

Speed monitors are used in case where it is necessary not to exceed certain speed limits in order to protect people plants and products against damage. The Speed monitors are used on escalators, conveyors, transfer lines, elevators as well as plants where several drives with a certain speed have to work together.

### Function

The measuring principle is to compare frequencies. With a proximity sensor the speed is converted to a speed proportional frequency. This frequency is compared to an internal adjustable frequency reference. If the measured frequency is higher then the reference the output relay is energised on an underspeed monitor or deenergised on an overspeed monitor. The output relay deenergises on an underspeed monitor if the speed goes under the settled hysteresis value. On the overspeed monitor the relay is energised. The reaction time is rather short, as the unit has no intergrating function. To calculate refer to formula in function diagram. The power supply for the proximity sensor is built into the unit. **The input is designed for pnp sensors.**

The speed monitor has an integrated start-up delay. The unit is delivered with a bridge between terminals X3-X4. The start-up delay is activated when the power supply is connected to A1-A2.

For the start-up time the output relay is energised. If no start-up delay is required, the bridge must be removed. The start-up delay can be activated also by external contacts connected to X3-X4.

The start-up delay normally is not required with overspeed monitoring. An LED indicates the connected power supply. A second LED indicates the state of the output relay.
